Weintek News - EasyBuilder Pro Introduces AI Assistant

In today's industrial automation landscape, HMI project development is becoming increasingly complex. Engineers are tasked with designing advanced control logic while managing multilingual translation requirements — all under tightening development timelines.

Weintek understands how demanding HMI development can be and strives to ease the burden of repetitive, time-consuming tasks.

Starting from EasyBuilder Pro V6.10.02, the software officially introduces two AI-powered features: the **AI Assistant Weinbot** and the new Auto **Translate** feature. These AI tools now accelerate HMI project development, simplify repetitive translation tasks, and free valuable time for critical logic design.

AI Assistant Weinbot: Elevating Development Efficiency

The built-in AI Assistant can directly read the current project information, enabling more precise and context-aware responses.

Key Advantages:

- **Automatic Model Identification:** Automatically detects the HMI model used in the project.
- **Program Optimization:** Analyzes uploaded JavaScript objects or Macros and provides optimization suggestions.

How to Activate the AI Assistant

1. Launch EasyBuilder Pro V6.10.02 or later.
2. In the toolbar, select [View] → [AI Assistant].
3. Enter your question and receive an instant response.

Note: An active internet connection is required.

AI Assistant Interface Overview

Mode Selection

The dropdown menu in the upper-right corner provides two modes:

- **Ask:** For general inquiries
- **Macro:** Dedicated to macro-related questions (Note: This mode does not support general questions.)

Attachment Function

Click the paperclip icon in the lower-left corner to attach project Macros or JS objects and ask questions directly about their content.

Auto Translation: Context-Aware, High-Quality Results

For multilingual projects, EasyBuilder Pro introduces **Auto Translate**, significantly reducing manual copy-and-paste work and accelerating project completion. Powered by Weinbot's **contextual understanding**, the system generates more accurate and natural translations while maintaining terminology consistency across languages.

How to Use Auto Translate

1. Go to **[Project]** → **[Language & Font]** and configure at least two languages.
2. Click **[Label]**. 
3. Create a new label in the Label Tag Library and select **[Auto Translate]**.

4. Choose the **Source Language** and **Target Language**.

5. Click **[Translate]** to generate translations automatically.

6. Review and apply the results to your project.

With AI-powered assistance, EasyBuilder Pro enables smarter, faster HMI development — from real-

time design guidance to seamless multilingual support. Engineers can work more efficiently and deploy projects to industrial applications with greater confidence.

Looking ahead, Weintek will continue advancing AI innovation, refining HMI solutions, and exploring a smarter, more intuitive, and human-centered future in industrial design.
